

Breaker Bars

Breaker Bars were design in conjunction with Duquesne Light Company for doors that were difficult to operate because of pressure differentials from the HVAC system.

The breaker bar provides a mechanical advantage of 6.25:1 to break the door open the first 1/2" and then changes to 3.33:1 while opening the door to 4".

This means that your smallest person can open doors that are subject to differential pressure without the risk of injury.

Reduce your workers comp claims and time lost from injury. Increase worker efficiency by decreasing the time it takes to get from one area to another.

Mounting Options

Pull Side

Push Side

Both Sides

Label

The breaker bar is easy to mount on existing doors and frames without the use of special tools or additional reinforcing.

Underwriter Laboratories listed for use on fire labeled doors.
